# 1 Introduction

This document describes the hardware features and some operational details of the FM191-RUA1 I/O Module. The FM191-RUA1 has a VITA57.1 FMC-LPC connector and follow the electronics specification and recommendation of the standard but is NOT form-factor compatible and will NOT fit all FMC carriers. Two versions are available. The FM191-R main features are a daughter card which provides 5V-TTL-compatible Analogue and Digital GPIOs that are suitable for robotics, motors and sensor application. The FM191-U is an expansion board which can be added to the FM191-R for delivering 4-port USB3.0 connectivity and more I/O pins on a 40-way header that follows Raspberry-PI pin-out. The additional board FM191-A1 provides easy connections to interface the 40 pin GPIO header.

The FM191-RUA1 is 100% compatible with the [EMC<sup>2</sup>-xxxx](#) PCIe/104 OneBank board that has different FPGAs SoM (System-on-Modules) from Xilinx or Microsemi. FM191-RUA1 does not have any PC/104 compatible bus interfaces, like PCIe or PCI. The FM191-RUA1 can safely be used with ANY carrier board that has a FMC connector, either directly onto the connector or via [Samtec SeaRay](#) cable, as long as it supports 1.8V Standards. No power is derived from the carrier and power has to be connected to the FM191-RUA1 with a suitable power-cable (supplied)

## 1.1 Main Features

### 1.1.1 Hardware

The FM191-R board is designed to fan out the FMC-LPC connector parallel I/Os and high-speed SerDes to five DB9 connectors and one SEIC connector.

The FM191-R was specially designed for the Sundance EMC<sup>2</sup> and other FPGA systems that have available a VITA57.1 FMC-LPC interface, for robotic/mobile applications.

The FM191-R provides connectivity to a wide range of 5V TTL sensors/actuators which are exposed to vibrations accessible via 5x DB9 connectors.

The FM191-U provides 4x USB3.0 ports for interfacing with high-speed sensors (e.g. depth sensors) or external storage (HDD/SSD) devices and provides 28 digital I/Os accessible via one 40-pin General Propose Input Output (GPIOs) connector.

The FM191-A1 fans-out the digital 40-pin GPIO I/Os from the FM191-U to 4x DB9 connectors.

### 1.1.2 Common Features

The common features of the FM191-RUA1 are:

- FMC LPC connector with I/O and single high-speed serial.
- Single +5 and +3.3V (external ATX connector) for powering external sensors via the DB9 connectors.
- 100-way SEIC peripheral interface connector.
- 15x single-ended digital I/Os 5V TTL are accessible via 3x DB9 (P3-P5).
- 12x analogue Inputs 5V TTL, with a resolution of 24-bits@2kSPS via 2x DB9 (P1-P2).
- 8x analogue Outputs 5V TTL, with a resolution of 12-bits via 2x DB9 (P2 and - P5).
- 4x USB3.0 connections and 28x single-ended digital I/Os 5V TTL 40-pin GPIO connectors available via the expansion FM191-U board.

- 28x single-ended digital I/Os 5V TTL accessible 4x DB9 (P6-P9) via the expansion board FM191-A1
- 4x DB9 connectors (P6-P9) to interface the 40 pin GPIO header via the expansion FM191-A1 board.

## 1.2 Notes

Several part numbers are described in the text, as Hyperlinks. These are possible part numbers, and alternative devices may be designed in at a later date. Hyperlinks will provide access to external sites for more details.

## 1.3 Abbreviations / Definitions

ADC	Analog to Digital Converter
DAC	Digital to Analogue Converter
EEPROM	Also called E <sup>2</sup> PROM (or just E <sup>2</sup> ). Electrically erasable and programmable ROM.
FPGA	Field Programmable Gate Array.
GPIO	General Purpose Input Output.
I <sup>C</sup>	Inter-integrated Circuit. A two wire low speed serial interface.
SEIC	Sundance External Interface Connector.
SPI	Serial Peripheral Interface

## 2 Block Diagram

The FM191-RUA1 system is composed of 3 boards, namely, the FM191-R, FM191-U and FM191-A1. Figure 1 shows a representation of the FM191-RUA1 board.

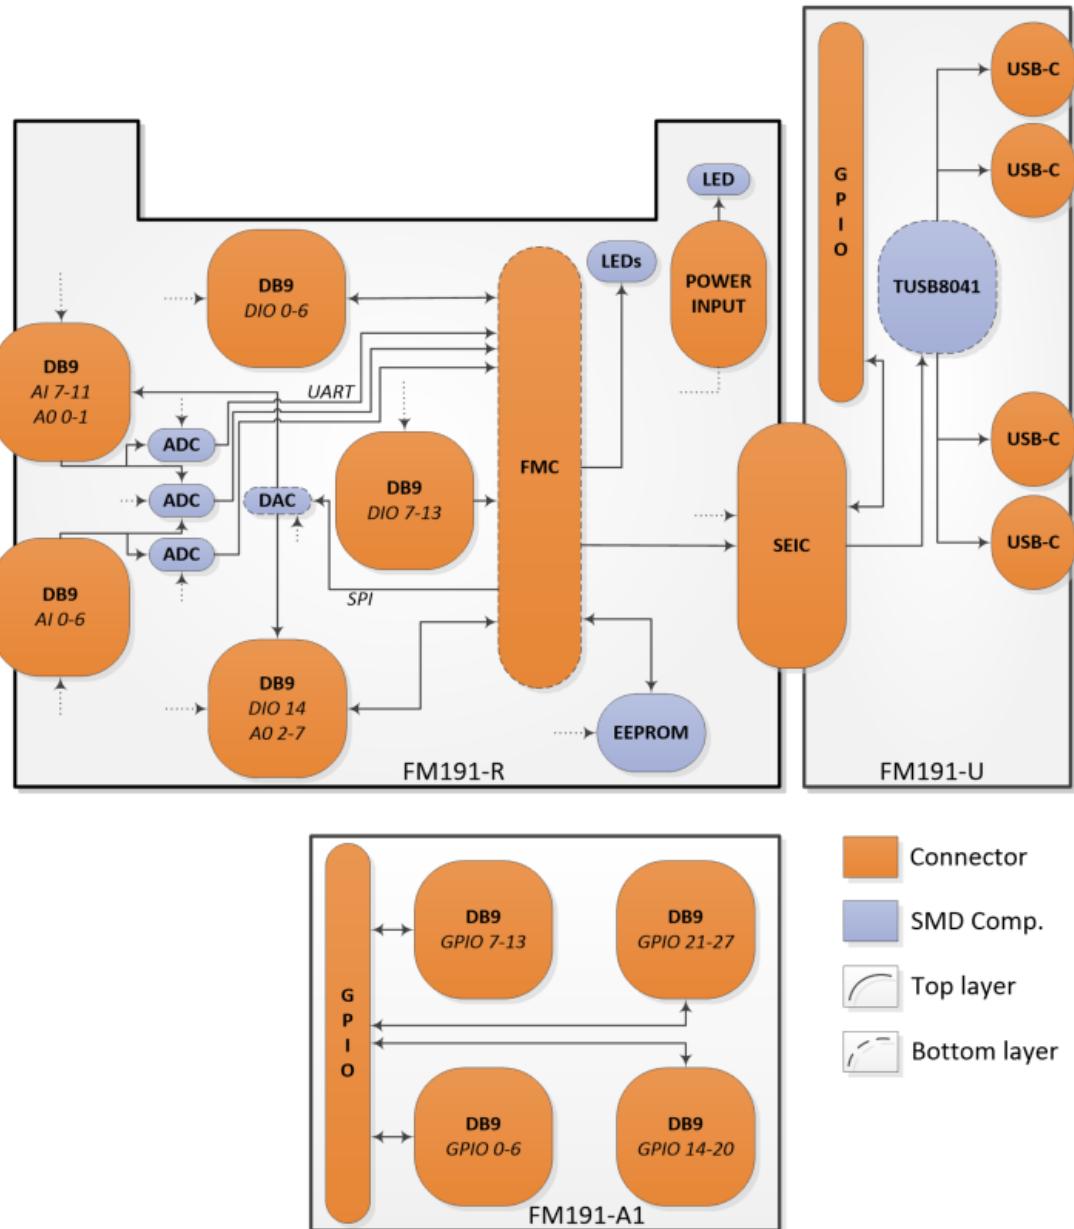

Figure 1: FM191-RUA1 block diagram

The main connectors of the FM191-R (Figure 1) are the 5x DB9 connectors (P1-P5). DB9 connectors were chosen because of their reliability, low-price and mechanic locking which is desirable in applications exposed to high level of vibrations.

Supplied by external 5V, the DIOs are shifted down to 1.8V previous to the FMC interface.

Similarly, both ADC outputs to the FMC and DAC inputs from the FMC are under 1.8V, shifted from 5V (ADC) and to 5V (DAC). These 5V are independent from both converters, and managed from two regulators which take external 12V.

The FMC connector not only interacts with the DB9s providing I/Os flexibility, but also supplying to the SEIC connector FMC-JTAG, FMC-I2C and some differential pairs. These features are not connected in FM191-U, but are present for other possible expansions in the future. Also, the pinout of the SEIC connector is compatible with the expansion board of EMC2-DP, which means that any I2C device in it could be used (HDMI). Equally, FM191-U can be used with EMC2-DP, having UART available at the GPIO header.

Apart from those signals, USB3.0 and GPIO are interconnected from the FMC.

The FM191-U is plugged via the SEIC connector and provides 4x USB3.0 ports - type C. Please note that this expansion board is **NOT COMPATIBLE** with the USB3.1. A 40-pin GPIO (compatible with the Raspberry PI V3) is also available and can be used to provide connectivity to a wide range of R-PI/Arduno shields. The 40-pin and DB9 connectors can provides up to 5V@2A (protected by an independent fuse) powered by the FM191-R.

The user may opt to use EMC2-DPV2 with FM191-U. **WARNING:** Please contact Sundance before attempting to connect the FM191-U to the EMC2-DPV2.

Users must be aware of the following when connecting the FM191-R to the EMC2-DPV2:

- The GPIO signals are 1.8V TTL, and therefore, injecting 5V TTL to any digital I/O would damage the FPGA module on the EMC2-DPV2;
- The USB3 chip is powered using 5V, which is not provided by the EMC2-DPV2 to the FM191-U.

These 2 issues can be solved using the jumpers J9 (1.8V) and J8 (5V) are available at FM191-U. **NOTE:** that 5V must be externally supplied via J8 or the USB3.0 will not work.

The FM191-A1 fans-out the 28x digital I/Os available on the FM191-U to 4x DB9 (P6-P9).

## 2.1 Local and external Power Supplies

The FM191-R is powered directly from an external power source via J1 connector ([ERNI 254831](#)).

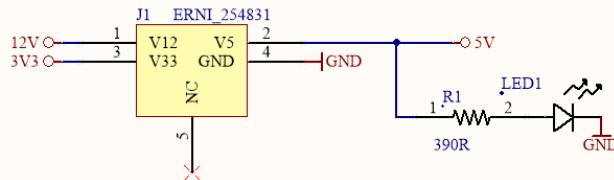

Figure 2: Schematics of the power connector.

One [MAX8556](#) DC-DC step-down converter (FM191-R) is used to create the local voltage of 1.8V@4A and one LM3674 to create the local voltage of 1.1V@0.6A.

The FM191-R must be powered (5V@14A and 3.3V@5A) by an external power source unit (e.g the [DCX6.360](#)) supply via the J1 5-pin power connector. External sensors and actuators can be powered via the DB9 (5V@2A per connector) and 40-pin (2-pins at 5V@2A and 2-pins 3.3V@2A) connectors.

ADCs and DAC are supplied with independent 5V each, from linear regulators ([LP4951C](#)) supplied with 12V input.

## 2.2 Level shifters

Seven TI [TWS0108E](#) are used for converting from 1.8V TTL single-ended I/Os to 5V. All the level shifters on the FM191-R.

## 2.3 I2C EEPROM

A 512x8bits ST [M24C04-F](#) EEPROM is available for storage small amounts of data which can programmed via the I<sup>2</sup>C bus (Figure 3). This device can be used to store operating parameters separate from the configuration Flash (e.g. Serial Number).

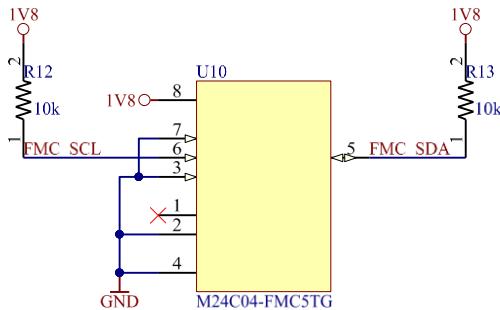

Figure 3: Schematics of the M24C04 EEPROM.

## 2.4 LEDs

LED 1 for sensing power from the ATX and 4 user LEDS (LED2-5) which can be freely configured by the user (Figure 4).

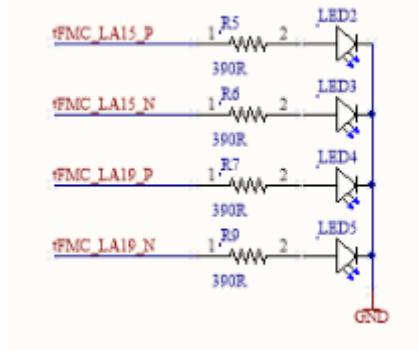

Figure 4: User LEDs

## 2.5 4-Port USB 3.0

One TI [TUSB8041](#) 4-port USB3.0 is used to provide 4x USB3.0 ports on the FM191-RU. The 4-ports can be accessed via the USB type C connectors. Please note that the FM191-RU is **NOT COMPATIBLE** with the USB3.1.

The TUSB8041 is physical wired to the Programmable Logic (PL) side via the signals tFMC\_TRZ\_RX\_P, tFMC\_TRZ\_RX\_N, tFMC\_LA06\_P, tFMC\_LA06\_N, tFMC\_TRZ\_TX\_P and tFMC\_TRZ\_TX\_N (see Table 2 for further details).

## 2.6 SEIC Module

The FM191-U is plugged to the FM191-R via the SEIC connector. One Samtec's [LSHM-150-01-L-DH-A-S-TR](#) is used in the FM191-R and one [LSHM-150-01-L-RH-A-S-TR](#) is used in the FM191-U. All the remaining pins in the FMC are routed to the SEIC connector, increasing the flexibility and enabling the possibility of creating future SEIC boards. Figure 5 shows the pin-map of the SEIC connectors for both boards.

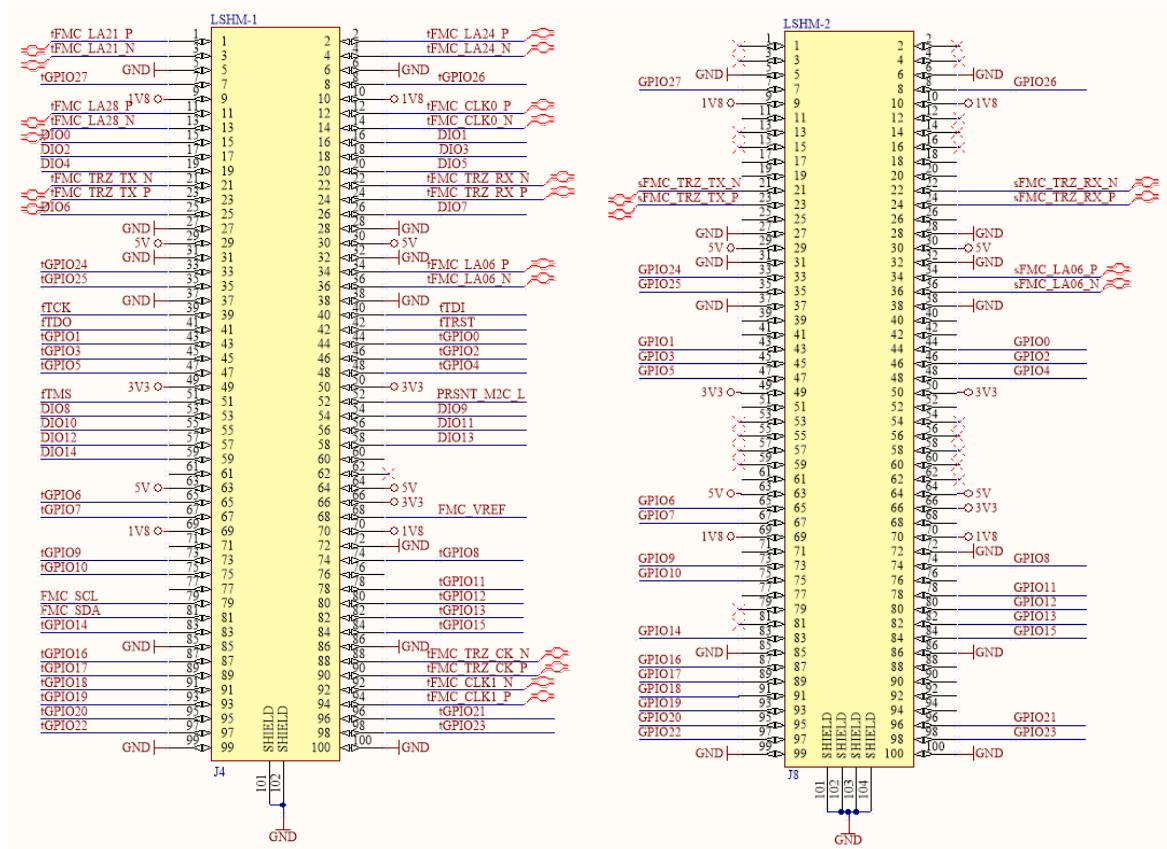

Figure 5: SEIC pin map in the FM191-R (left) and FM191-U (right)

## 2.7 VITA57.1 FMC-LPC I/O Module

The LPC (low-pin count) variant provides 34 differential I/O or 68x single-ended I/Os and 2 clocks as differential pairs. I<sup>2</sup>C and JTAG signals are also present. Background information here. A pin-out is provided at the end of this document and the signal names is shown in Figure 6.

Further details about the FMC-LPC module can be found in the following link [http://en.wikipedia.org/wiki/FPGA\\_Mezzanine\\_Card](http://en.wikipedia.org/wiki/FPGA_Mezzanine_Card).

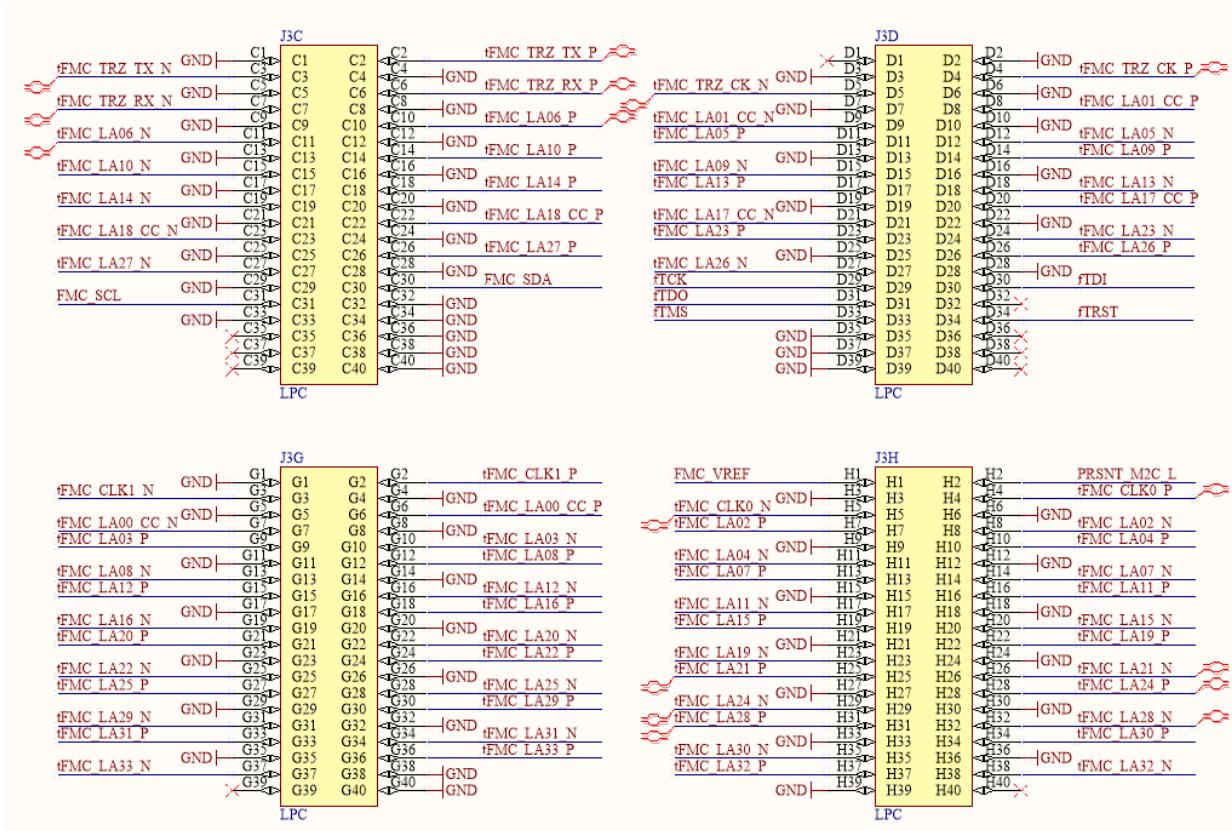

Figure 6: FMC-LPC pinout

## 2.8 ADC

Three TI [ADS122U04](#) 24bit, 4-channel, 2kSPS with UART interface are used for providing the 12x Analogue inputs 5V TTL. The ADCs channels are accessible via the P1 and P2 DB9 connectors. Analogue channels 0 to 6 (AO0-AO6) are accessible via P1 and AO7-AO11 via P2 connectors. Each ADC IC is programmed via a dedicated UART ports (UART1 to UART3).

Each DB9 (pin 1) supplies up to 5v@2A and it is protected with a fuse. Figure 7,

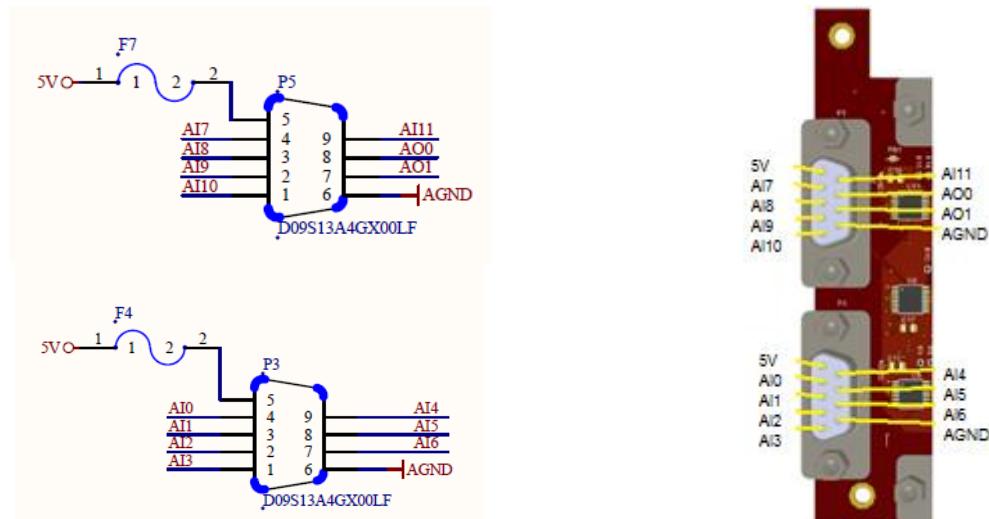

Figure 8 and Figure 9 show the schematics of the signals of the level shifters, connectors and ADC ICs.

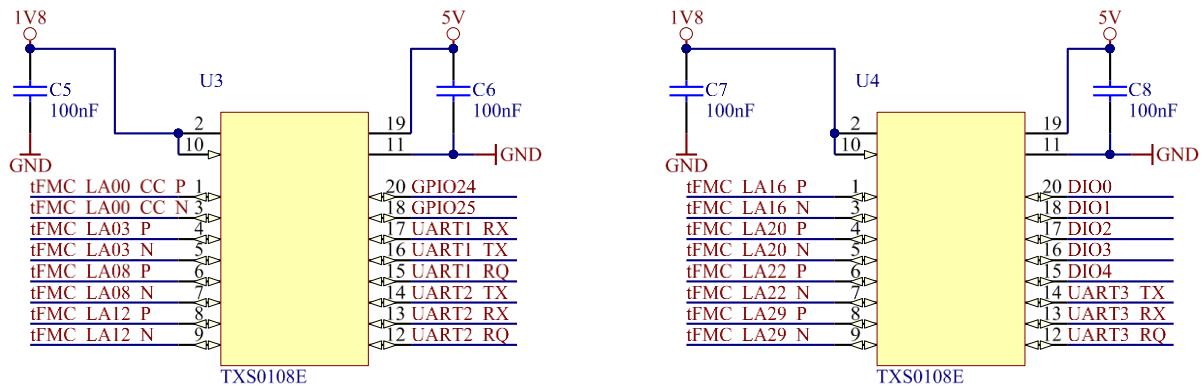

Figure 7: Schematics of the level shifters and pin-map of the UART ports.

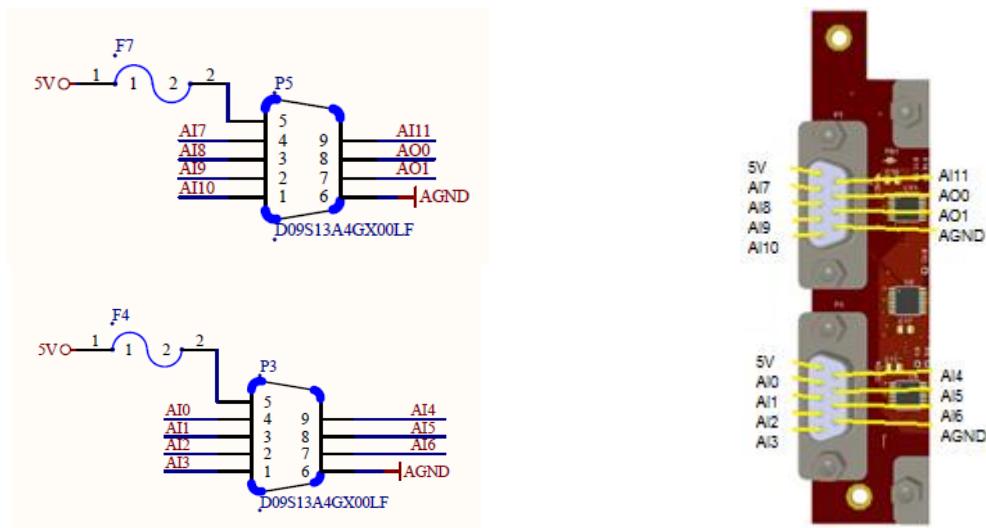

Figure 8: Schematics of P3 and P5 DB9 connectors (AIs)

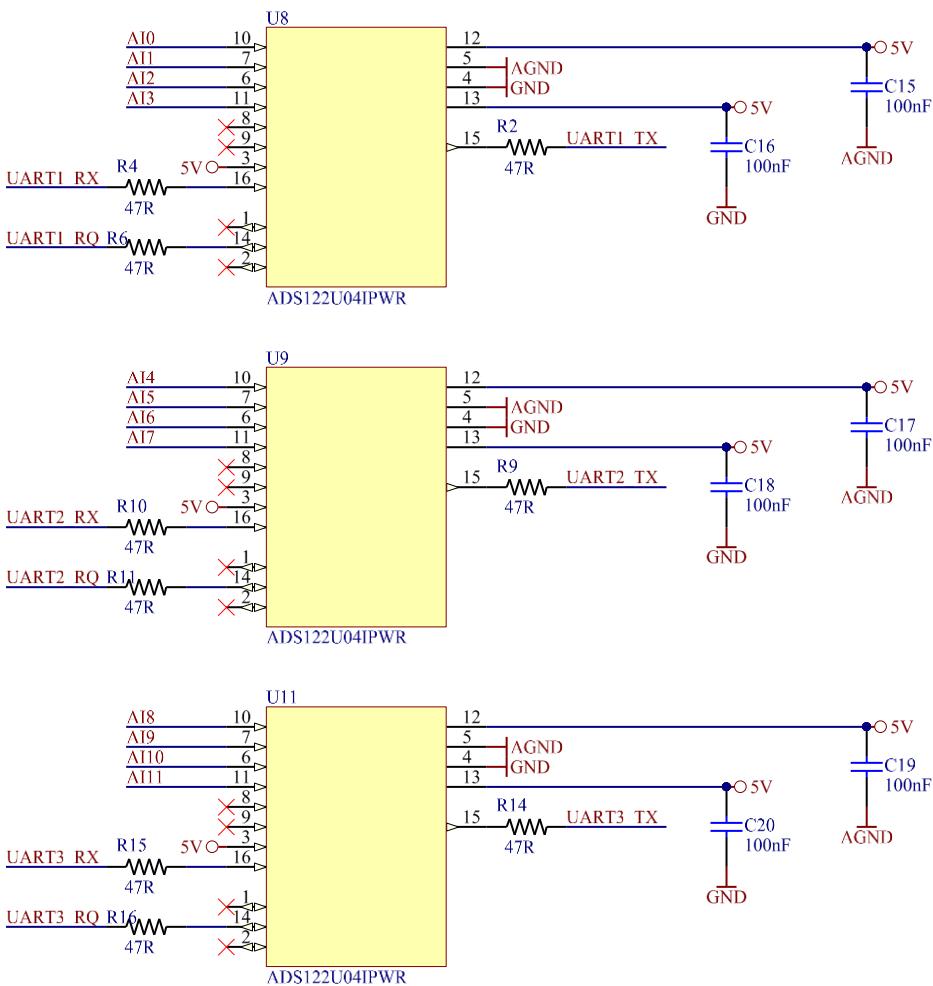

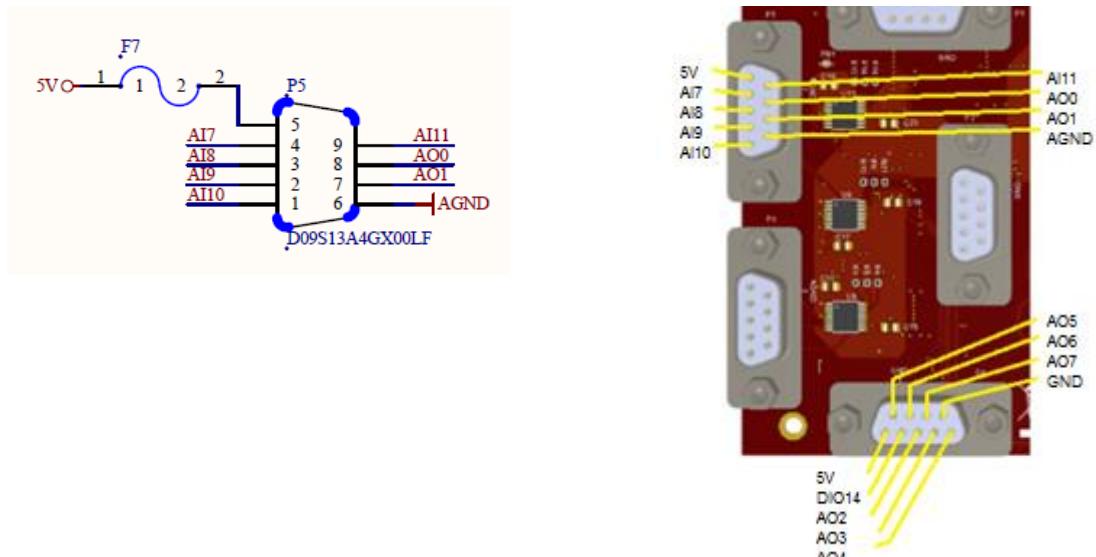

Figure 9: Schematics of the Analogue channels

## 2.9 DAC

One TI [DAC6058Z](#) 12bit, 8-channel with SPI interface is used for providing the 8x Analogue Outputs 5V TTL. The DACs channels are accessible via the P2 and P5 DB9 connectors. Analogue channels 0 to 1 (AO0-AO1) are accessible via P2 and AO2-A7 via P5 connectors. The DAC is programmed via a dedicated SPI ports.

Each DB9 (pin 1) supplies up to 5v@2A and it is protected with a fuse. Figure 10,

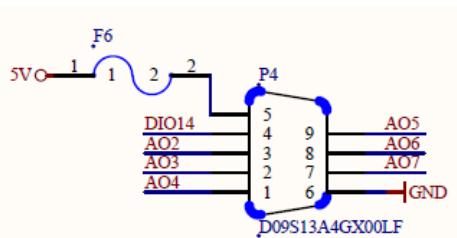

Figure 11, Figure 12 show the schematics of the signals of the level shifters, connectors and DAC IC.

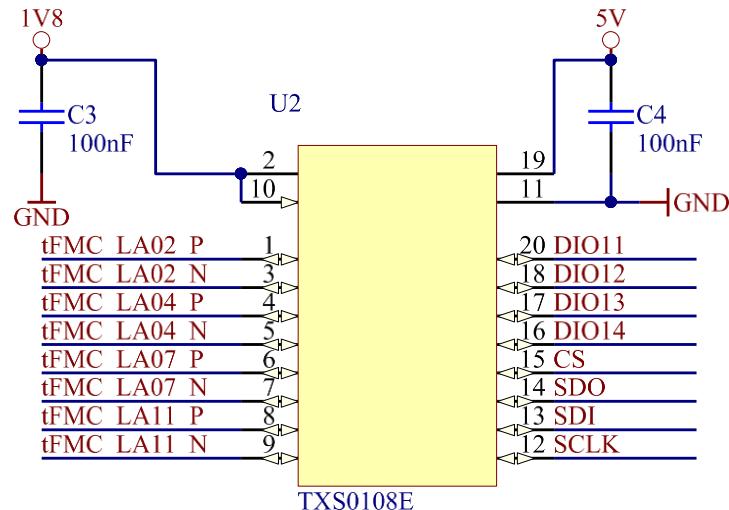

Figure 10: Schematics of the level shifters and pin-map of the SPI signals (CS, SDO, SDI, SDO).

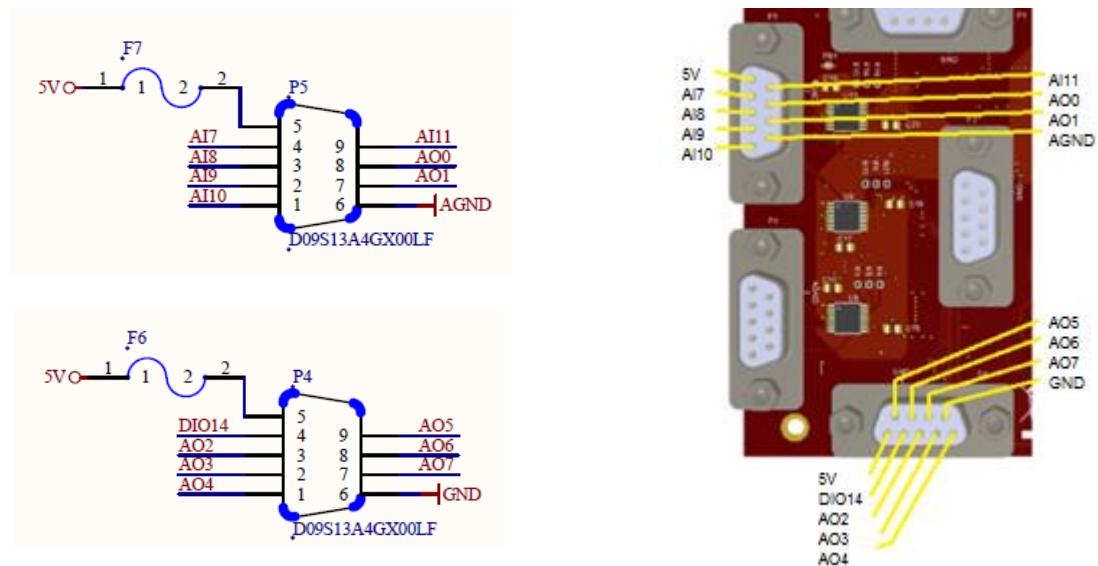

Figure 11: Schematics of P5 and P4 DB9 connectors (AOs)

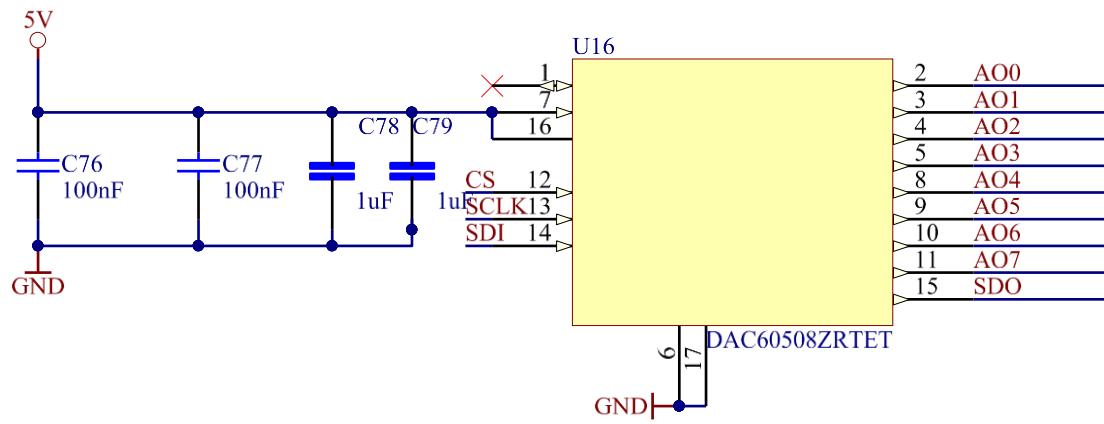

Figure 12: Schematics of the DAC

## 2.10 Single ended I/Os

15x digital I/Os (DIOs) 5V TTL are accessible via the P3, P4 and P5 DB9 connectors. P3 provides access to D0-D6, P4 to D7 - D13 and P5 to D14. Each DB9 (pin 1) supplies up to 5V@2A (per pin) and it is protected with a fuse.

28x general propose I/Os (GPIO0-GPIO27) 5V TTL are accessible via the 40-pin GPIOs. 5V@2A (per pin) can be driven from Pins 1 and 3 and 3V3@2A (the absolute maximum for both pins is 3A) from pins 2 and 4 and the pins are protected by fuses (

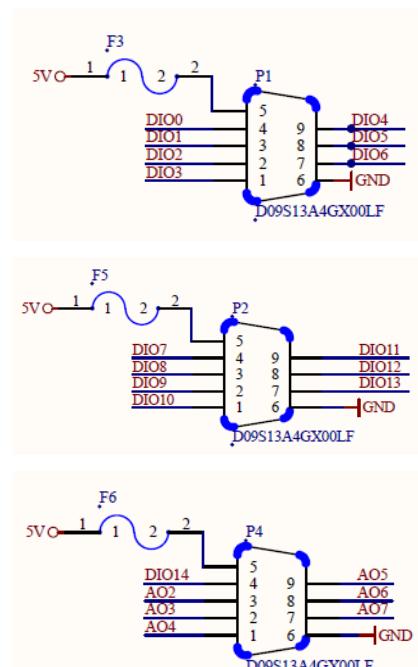

Figure 13, Figure 14,

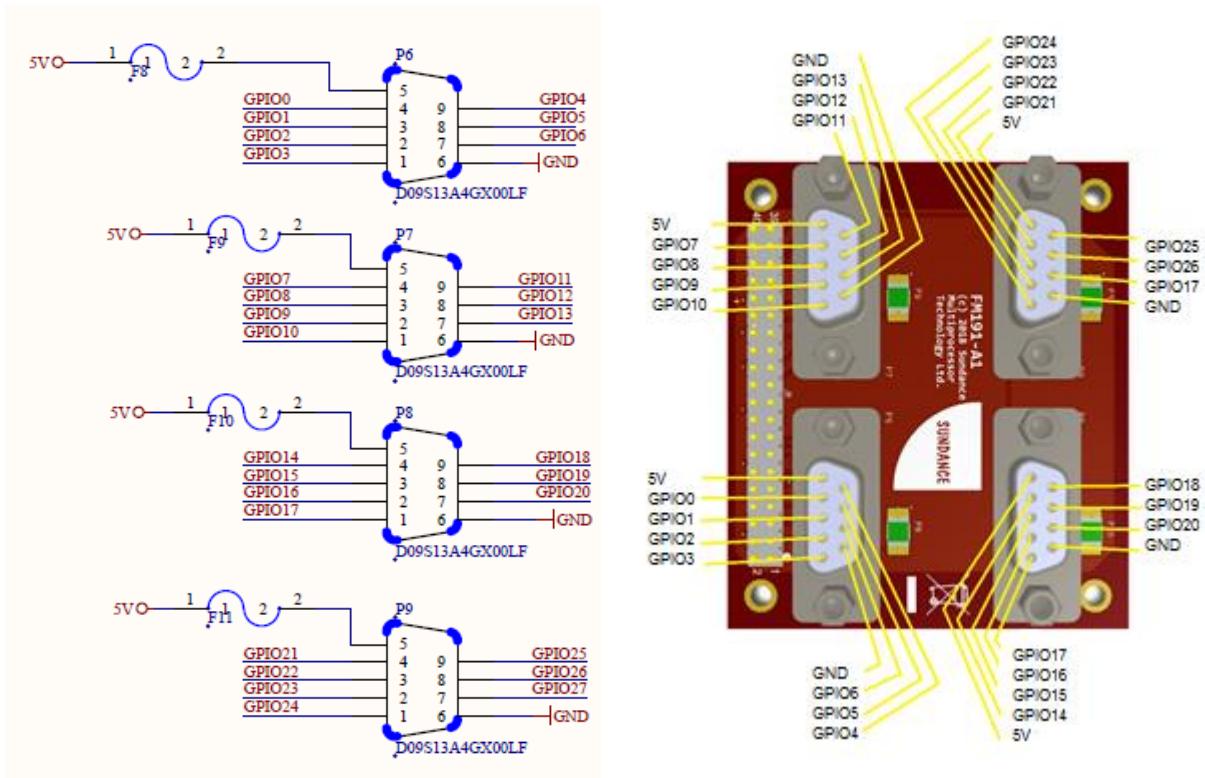

Figure 15, Figure 16, Figure 17 and Figure 18).

## 5 Design Release & Quality

The full schematic will be available Sundance as will the FPGA reference designs to interface the FM191 to a EMC<sup>2</sup>-Z7030 Zynq Module and a software package that will allow control of EMC<sup>2</sup> + FM191 from any Ethernet port. The framework will be <http://www.ros.org/> compatible.

All components on FM191-RUA1 are extended temperature range, suitable for industrial applications in terms of temperature, but does not comply to any IP rating for moisture.

Verification, Review & Validation Procedures to be carried out in accordance with the [Sundance Quality Procedures](#) (ISO9001-2015).

## 6 Safety

This module presents no hazard to the user when in normal use.

## 7 EMC

The FM191-RUA1 system is designed to operate from within an enclosed host system, which is built to provide EMC shielding. Operation within the EU EMC guidelines is not guaranteed unless it is installed within an adequate enclosure.

This module is protected from damage by fast voltage transients originating from outside the host system which may be introduced through the output cables.

Short circuiting any output to ground does not cause the host PC system to lock up or reboot.

## 8 Ordering Information

Order number:

<b>FM191-R</b>	ADC Input, DAC Output and Digital I/O
<b>FM191-RU</b>	As above, but added SEIC with I/O + USB3.0
<b>FM191-RUA1</b>	As above, but added the GPIO extension board
<b>oi928-Z7030-R</b>	EMC <sup>2</sup> -Z7030 + FM191-R
<b>oi928-Z7030-RU</b>	EMC <sup>2</sup> -Z7030 + FM191-RU
<b>oi928-Z7030-RUA1</b>	EMC <sup>2</sup> -Z7030 + FM191-RUA1
